# Ergonomic Risk Factors & Control Methods

*Mark Middlesworth*

# MSD Risk Factors

**ERGONOMIC  
RISK FACTORS**

- FORCE
- REPETITION
- POSTURE

Over time, exposure to risk factors leads to MSD.

**INDIVIDUAL  
RISK FACTORS**

- POOR WORK PRACTICES
- POOR HEALTH PROFILE
- NO RECOGNITION OF EARLY  
WARNING SIGNS

**MSD**

# MSD Prevention Controls

# Primary Ergonomic Risk Factors

There are three primary ergonomic risk factors:

- 1. HIGH TASK REPETITION**
- 2. FORCEFUL EXERTIONS**
- 3. REPETITIVE / SUSTAINED AWKWARD POSTURES**

# Primary Ergonomic Risk Factors

**REPETITION**

FORCE

POSTURE

## RISK FACTOR: HIGH TASK REPETITION

Many work tasks and cycles are **repetitive in nature**, and are frequently controlled by hourly or daily production targets and work processes.

High task repetition, when combined with other risks factors such high force and/or awkward postures, can contribute to the formation of MSD. A job is considered highly repetitive if the cycle time is 30 seconds or less.

# Primary Ergonomic Risk Factors

REPETITION

FORCE

POSTURE

## CONTROL METHODS FOR HIGH TASK REPETITION

### Engineering Controls

Eliminating excessive force and awkward posture requirements will reduce worker fatigue and allow high repetition tasks to be performed without a significant increase in MSD risk for most workers.

# Primary Ergonomic Risk Factors

**REPETITION**

FORCE

POSTURE

## CONTROL METHODS FOR HIGH TASK REPETITION

### **Work Practice Controls**

Providing safe & effective procedures for completing work tasks can reduce MSD risk. In addition, workers should be trained on proper work technique and encouraged to accept their responsibilities for MSD prevention.

# Primary Ergonomic Risk Factors

**REPETITION**

FORCE

POSTURE

## CONTROL METHODS FOR HIGH TASK REPETITION

### **Job Rotation**

Job task enlargement is a way to reduce duration, frequency and severity of MSD risk factors. Workers can rotate between workstations and tasks to avoid prolonged periods of performing a single task, thereby reducing fatigue that can lead to MSD.

# Primary Ergonomic Risk Factors

**REPETITION**

FORCE

POSTURE

## CONTROL METHODS FOR HIGH TASK REPETITION

### **Counteractive Stretch Breaks**

Implement rest or stretch breaks to provide an opportunity for increased circulation needed for recovery.

# Primary Ergonomic Risk Factors

REPETITION

**FORCE**

POSTURE

## RISK FACTOR: EXCESSIVE FORCE

Many work tasks require high force loads on the human body.

Muscle effort increases in response to high force requirements, increasing associated fatigue which can lead to MSD.

# Primary Ergonomic Risk Factors

REPETITION

**FORCE**

POSTURE

## CONTROL METHODS FOR EXCESSIVE FORCE

### Engineering Controls

Eliminating excessive force requirements will reduce worker fatigue and the risk of MSD formation in most workers. Using mechanical assists, counter balance systems, adjustable height lift tables and workstations, powered equipment and ergonomic tools will reduce work effort and muscle exertions.

# Primary Ergonomic Risk Factors

REPETITION

**FORCE**

POSTURE

## CONTROL METHODS FOR EXCESSIVE FORCE

### Work Practice Controls

Work process improvements such as using carts and dollies to reduce lifting and carrying demands, sliding objects instead of carrying or lifting, and eliminating any reaching obstruction to reduce the lever arm required to lift the object.

# Primary Ergonomic Risk Factors

REPETITION

**FORCE**

POSTURE

## CONTROL METHODS FOR EXCESSIVE FORCE

### **Proper Body Mechanics**

Workers should be trained to use proper lifting and work techniques to reduce force requirements.

# Primary Ergonomic Risk Factors

REPETITION

FORCE

**POSTURE**

## **RISK FACTOR: SUSTAINED AWKWARD POSTURES**

Awkward postures place excessive force on joints and overload the muscles and tendons around the effected joint. Joints of the body are most efficient when they operate closest to the mid-range motion of the joint.

Risk of MSD is increased when joints are worked outside of this mid-range repetitively or for sustained periods of time without adequate recovery time.

# Primary Ergonomic Risk Factors

REPETITION

FORCE

**POSTURE**

## CONTROL METHODS FOR SUSTAINED, AWKWARD POSTURES

### **Engineering Controls**

Eliminate or reduce awkward postures with ergonomic modifications that seek to maintain joint range of motion to accomplish work tasks within the mid-range of motion positions for vulnerable joints. Proper ergonomic tools should be utilized that allow workers to maintain optimal joint positions.

# Primary Ergonomic Risk Factors

REPETITION

FORCE

**POSTURE**

## CONTROL METHODS FOR SUSTAINED, AWKWARD POSTURES

### **Work Practice Controls**

Work procedures that consider and reduce awkward postures should be implemented. In addition, workers should be trained on proper work technique and encouraged to accept their responsibility to use their body properly and to avoid awkward postures whenever possible.

# Primary Ergonomic Risk Factors

REPETITION

FORCE

**POSTURE**

## CONTROL METHODS FOR SUSTAINED, AWKWARD POSTURES

### **Job Rotation**

Job rotation and job task enlargement is a way to reduce repeated and sustained awkward postures that can lead to MSD.

# Primary Ergonomic Risk Factors

REPETITION

FORCE

**POSTURE**

## CONTROL METHODS FOR SUSTAINED, AWKWARD POSTURES

### **Counteractive Stretch Breaks**

Implement rest or stretch breaks to provide an opportunity to counteract any repeated or sustained awkward postures and allow for adequate recovery time.
